Professional Profile

Full-Stack Software Engineer focused on software architecture and application security. I design systems end to end (React, Angular, Vue.js, Spring Boot, Django, PostgreSQL), defining the structure before the first line of code: module boundaries, data contracts, and decisions recorded in versioned ADRs. I build security in from the design stage (RBAC, JWT, threat modelling, SAST and SCA in the pipeline) and deploy on AWS and Docker with CI/CD. Software Engineering graduate of Universidad Cooperativa de Colombia, currently pursuing a postgraduate specialization in Information Security at Politécnico Grancolombiano. Bilingual (English C1, EF SET), open to relocation.

Experience

I.P.S. San José, Software Engineer – Villagarzón, Putumayo, Colombia Sept 2026 – Nov 2026

- Responsible for the development, implementation and maintenance of the information systems of a healthcare provider institution, including the administration of its databases.
- Built an inventory manager and automations for the internal processes of the institution.
- Started the development of a DICOM medical imaging viewer for the institution, aimed at 2D/3D multiplanar reconstruction (MPR), PET-CT study fusion and connection as a PACS client.
- Provided technical support and incident resolution for operational and administrative processes.

Alcaldía de Pasto (City Government), Full-Stack Software Engineering Intern – Pasto, Colombia Oct 2025 – Dec 2025

- Built the maintenance-management system of a public-sector entity end to end, covering the user interface, the backend logic and the data model, and delivered it in operation within the three months of the internship.
- Implemented Role-Based Access Control (RBAC) and server-side input sanitization on a system holding government records, closing the SQL injection and XSS paths before it went into production.
- Restructured the data access layer and optimized queries once response times became the bottleneck, reducing latency on the most heavily used query screens.

ElevaForge, Co-Founder and Software Engineer – Remote June 2025 – present

- Co-founded a 3-engineer software studio and owned the product architecture decisions: I defined the module boundaries and the data contracts, and recorded every decision and its discarded alternatives in versioned ADRs, so the team can review them without depending on me.
- Led the migration of the corporate site from Angular to Next.js 14, planned layer by layer so the new structure absorbed the existing content instead of rebuilding it.
- Designed the platform authorization model as deny-by-default: Row Level Security enabled with no policy at all for the anonymous or the authenticated role, and all data access routed through the server, so the public key shipped to the browser enables no query.
- Established a CI security baseline that runs on every deploy (CodeQL, custom Semgrep rules, audit-ci and Lighthouse CI gates), so a finding stops the delivery instead of surfacing in production.
- Built elevaforge.com and the KOA demo vertical (landing and e-commerce) with a multi-account admin panel the team uses to edit packages, projects and content without a deploy in between.

Estación de Servicio Kennedy, IT and Systems Contractor – Pasto, Colombia Mar 2023 – Mar 2026

- IT contractor for three consecutive years, responsible for the development, implementation and maintenance of the information systems of an operating fuel station.
- Managed the business databases and optimised the inventory and sales control tools, the day to day operation the till and fuel supply depended on.
- Was the standing technical point of contact: support for operational and administrative processes, and incident resolution on the company management systems as they came up, not under a fixed-hours contract.

Freelance, Full-Stack Software Developer – Remote Mar 2023 – present

- Served clients part-time alongside my degree and, later, alongside the internship at Alcaldía de Pasto, until I formalized that product discipline by co-founding ElevaForge in mid-2025.
- Took on engagements of different scope depending on the client: frontend interfaces, backend services, complete builds from the interface through to deployment, internal process automation, and security audits of applications already in operation.
- Executed data migrations to SAP and Oracle NetSuite applying encryption and prior backups, so every cutover had a tested rollback path before the first record moved.
- Implemented custom CRM solutions (Salesforce, HubSpot) for e-commerce businesses, including role-based access control configuration so each user works only on the accounts assigned to them.
- Built automated reporting systems with Odoo, Python and PostgreSQL that replaced manual data consolidation with periodic report generation for business analysis.
- Part of this work is covered by confidentiality agreements, so each engagement is described by its type of work and its stack, never by the client or its data.

Education

Universidad Cooperativa de Colombia, BEng in Software Engineering – Pasto, Colombia Feb 2022 – Dec 2025

- Capstone project: REST API for physical space management with AI support, using JWT authentication and secure secrets management.
- Relevant coursework: Scalable Systems Architecture, Back-End Development, Agile Methodologies (Scrum), Cybersecurity, Network Security.

Politécnico Grancolombiano, Postgraduate Specialization in Information Security – Colombia Jan 2026 – present

- In progress, expected completion: 2027.

Certifications

Cybersecurity, MinTIC Colombia (Sept 2024)

Network Security, Cisco (Dec 2024)

Agile Software Development and Scrum, IBM (Jan 2025)

Building Scalable Systems, IBM (Feb 2025)

Introduction to Back-End Development, Meta (Feb 2025)

AI and Productivity Certifications, Microsoft & LinkedIn (Feb 2025)

Skills

Architecture: Scalable system design, Hexagonal architecture, Layered separation, REST API design, Data modelling, ADRs, Multi-tenant isolation

Development: React, Next.js, Vue.js, Angular, Spring Boot, Django, JavaScript, TypeScript, Java, Python, C#

Security & DevOps: RBAC, JWT, Threat modelling, Secure coding practices, SAST and SCA in CI (CodeQL, Semgrep), Docker, AWS (EC2, S3), CI/CD, Network security

Databases: PostgreSQL, MySQL, MongoDB, Versioned migrations (Flyway)

Languages: Spanish (Native), English (Advanced C1, EF SET Certified)
